

Product sheet

Shuttle removal

New guide system for KNCA double turn.

For higher reliability and improved performance

The new designed guide system will replace the old shuttle guide and hydraulic cylinder. The number of moving parts have been reduced while developing the new guide system, this will lead to less maintenance and less downtime due to issues caused by the shuttle guide and the hydraulic cylinder.

Customer Service

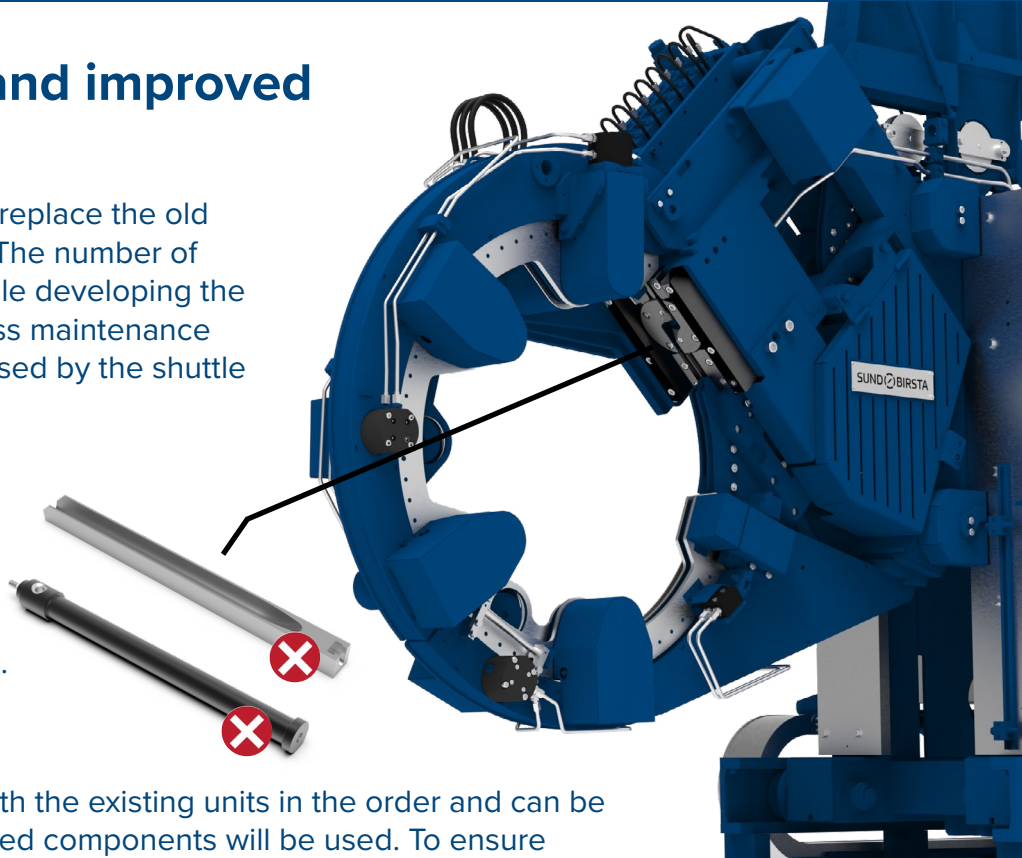

Sund Birsta offers to do exchange of the upgrade kit, to reduced cost by our experienced supervisor, if service is booked in at the same time.

Compatibility

The new units are fully compatible with the existing units in the order and can be swapped without any issues. Described components will be used. To ensure compatibility, the Sund Birsta Customer Service department has to evaluate machine documentation before processing a possible order.

We can offer other kits

We have product and spare part specialists which have studied every single mechanism and accessory, both current and legacy, and from experience identifies which parts should be replaced during maintenance. Contact Sund Birsta for more information about your product.
